"Kunitz-type proteinase inhibitors derived by limited proteolysis of
the inter-alpha-trypsin inhibitor, VII. Characterization of the bovine
inhibitor as double-headed trypsin-elastase inhibitor.";

Hoppe-Seyler's Z. Physiol. Chem. 364:1689-1696(1983).

-I-FUNCTION: Alpha-1-microglobulin occurs in many physiological
fluids including plasma, urine, and cerebrospinal fluid. It
appears not only as a free monomer but also in complexes with IgA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Kunitz-type proteinase inhibitors derived by limited proteolysis o the inter-alpha-trypsin inhibitor, VII. Determination of the aminoacid sequence of the trypsin-released inhibitor from bovine interalpha-trypsin inhibitor.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      trypsin-released inhibitors from
inhibitors.";

SUBUNIT: I-alpha-I plasma protease inhibitors are assembled from support or two heavy chains (H1, H2 or H3) and one light chain, bikunin. Inter-alpha-inhibitor (I-alpha-I) is composed of H1, H2 and bikunin, inter-alpha-like inhibitor (I-alpha-L1) of H2 and bikunin, and pre-alpha-inhibitor (P-alpha-I) of H3 and bikunin (I-alpha-I) of H3 an

whereas the second domain is a strong inhibitor of trypsin, the contains two homologous domains.

CC first domain interacts weakly with PMN-granulocytic elastase and contains the pancreatic elastase.

CC indictivation for secreted.

CC determine the specificity of the inhibition of domain I.

CC chymotrypsin and elastase; those with leucine interact weakly with CC chymotrypsin and elastase; those with leucine interact strongly.

CC inhibitors with methionine in this position interact weakly with contains 2 BPTI/Kunitz inhibitor domains.

TISSUE SPECIFICITY: Expressed by the liver
PTM: The precursor is proteolytically proce
separately functioning proteins.
PTM: Alpha-1-microglobulin contains covalen
chromophores (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      appears not only as a free monomer but also in complexes with I and albumin (By similarity).

FUNCTION: Inter-alpha-trypsin inhibitor, present in plasma and urine, inhibits trypsin, plasmin, and lysosomal granulocytic elastase (By similarity).

SUBUNIT: I-alpha-I plasma protease inhibitors are assembled fro one or two heavy chains (HI, H2 or H3) and one light chain, bikunin. Inter-alpha-inhibitor (I-alpha-I) is composed of H1, H and bikunin, inter-alpha-like inhibitor (I-alpha-LI) of H2 and bikunin, and pre-alpha-inhibitor (P-alpha-I) of H3 and bikunin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            similarity).

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.

PTM: The precursor is proteolytically processed into two

separately functioning proteins.

separately functioning proteins.

PTM: Alpha-1-microglobulin contains covalently linked brown-yellow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chim. Blophys. Acta 1209:286-292(1999).
FUNCTION: Alpha-1-microglobulin occurs in many physiological FUNCTION: Department and cerebrospinal fluid. It fluids including plasma, urine, and cerebrospinal fluid. It

Inhibitors with methionine in this position of domain I. Inhibitors with methionine in this position interact weakly with chymotrypsin and elastase; those with leucine interact strongly.

-i- SIMILARITY: Contains 2 BPTI/Kunitz inhibitor domains.

"The amino-acid sequence of the trypsin-released inhibitor from sheep
inter-alpha-trypsin inhibitor.",
Biol. Chem. Hoppe-Seyler 368:727-731(1987).
-!- FUNCTION: This inhibitory fragment, released from native ITI after
limited proteolysis with trypsin, contains two homologous domains.
Whereas the second domain is a strong inhibitor of trypsin, the
first domain interacts weakly with PMN-granulocytic elastase and
not at all with pancreatic elastase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MISCELLANEOUS: The amino acid at position p2' (17) appears to determine the specificity of the inhibition of domain I. Inhibitors with methionine in this position interact weakly with chymotrypsin and elastase; those with leucine interact strongly. SIMILARITY: Contains 2 BPTI/Kunitz inhibitor domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A29652; A29652.
                                                                                                                                                                                                                                                                                                                                                                                    59

                                                                                                                                                                        fluids including plasma, urine, and cerebrospinal fluid appears not only as a free monomer but also in complexe and albumin (By similarity).

FUNCTION: Inter-alpha-trypsin inhibitor, present in pla urine, inhibits trypsin, plasmin, and lysosomal granulo elastase (By similarity).

FUNCTION: Trypstatin is a trypsin inhibitor. It inhibit coagulation factor Xa and tryptase about 100-fold more than porcine pancreatic trypsin and chymase. It is a mo is also found in mast cells as a complex with tryptase
SUBUNIT: I-alpha-I plasma protease inhibitors are assembled from one or two heavy chains (H1, H2 or H3) and one light chain, bikunin. Inter-alpha-inhibitor (I-alpha-I) is composed of H1, H2 and bikunin, inter-alpha-like inhibitor (I-alpha-LI) of H2 and bikunin, and pre-alpha-inhibitor (P-alpha-I) of H3 and bikunin (H2)
